

Day 14

Main And local Integration process

* What is the difference between main integration process and local integration process

→ Main Integration process → This is the place where we write all the logic and process the data from one system to another system i.e. is main integration process → How we will identify that → By using —

SAP Symbol

→ Can we use multiple main integration processes

in one place → yes we can

So then that flow will be considered as single message or multiple messages

Ans → It will be considered as multiple messages

* So main integration flow means → Sending the data from one system (Source) to Receiver (Target)

This should happen in only Main Integration process only

* Local Integration process:

To call Reusable logical Where ever we want within that iflow only ✓

* The Remembering point is the symbol for Main integration process and Local Integration process

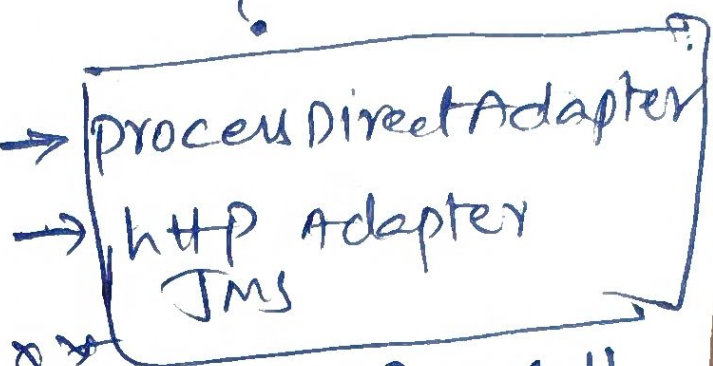

* here when we observe that main Integration process has 4 → local Integration process

* Can we call local Integration process from Outside System → no

* → from Main integration process → Yes
from Exception subprocess → Yes

* If you want to call from 1st Integration flow to second integration flow ? How
(2nd)

→ We can do it by using

*** We can call
Important

Important points :

① Can we send data from Source (postman) to cpi → local Integration process ?

→ NO

Because, It cannot transfer data from Source System to Target System. So we cannot use that (local Integration process)

∴ The data sending from postman should hit the SAP cpi's main Integration flow only

* Simulation → Design tab (node)
postman → Runtime (node)
