Day 33

Mapping

* Mapping → Transformation
* What is mapping: Transforming the structure from one format to other Format

Source structure to target Structure

{ Conversion
Transformation
mapping } → any operation

* **Message mapping** → Where we can map Source message to target message

Prerequisite: Structure (Data)

until unless you don't know about the structure you cannot do mapping

eg: xml → Structure (XSD)

↓

Important

with out this schema definition you cannot do the mapping

→ when you are working with message pallete mapping

the first and fore most important prerequi site is XSD document (Scheme definition)

* demo: [OrdersInfo.xml] → file used

Scenario: We will recieve data in the format of OrdersInfo. and Iw ill Send products Information

Source (1st xml) Target (2nd xml)

So, we receiving order's level Information and we need to send product's level Information to the target

* Whiledoing mapping → we need to put concentration on occurences → mandatory fields

Let's take Real time example :

You are doing a project → In this project you need to do the mapping (message)

↓

Constraint: Now the point is how you will know how to map which field → to → which field

(***) So, we need a mapping Template (or) mapping sheet

This document has vast information like Source field, Source technical name, occurence, description, same for Target details.

⇒ we need to focus on 3 fields out of those

① Source field ✓
② Target Field ✓
③ Transformation logic ✓

* Required document: mapping sheet.xlsx ✓

We need to get the mapping sheet from either Source team or target team

⇒ Mostly we will get it from the functional team ✓

* The important → how will you tell that how many times that node should come in Target → Based on that node that is occured in Source data → those many times that node should come in Target ✓ in message mapping

* copy xpath

* one on one mapping

* Logic ⟶ Cost * Quantity

* How you will achieve some transformation in message mapping

Logic
↓
We can achieve it by using

→ mapping Expressions

Standard functions
① Arithmetic
② Boolean
③ constants
④ Conversions
⑤ Date
⑥ Node functions (most important)
⑦ Statistic
⑧ Text

↓
with out this there is no message mapping
