

Day 12

Content modifier Part ③

* What are the data format's in CP1?

eg: Emp ID = 1006

emp name = Bhavath

designation = developer

Company = Infosys

* Now the point is → if we want to send the above data in CP1 how we will send

* The important point is we should not send the data to the CP1 system like whatever you want format → we need to send the data as required format

Sap CP1 → required format → XML (only)

* If we want to send the data in CSV, JSON, XML we can send

* The Pallets Which are SAP CPI → Those Pallets will process the data in XML to the target System

→ All the Pallets → understand (XML)

* data format → How you are transforming data from one System to another System (Source → Target) and how you are managing the data for that we will call it as data format

* SAP CPI → CSV, XML, JSON(data)

* XML → root tag, parent tags, child tags
Basically open & closed tag's

* eg: <?xml version="1.0" encoding="UTF-8">
XML Declaration
(file Introduction to read)

Sub elements (or) data elements

<employee> → (root node) → Parent tag

<id> 1006 </id> → element

<name> Bharath </name> → value

<designation> developer </designation>

<Company> Infosys </Company>

</employee>

* eg: To read name from above xml ?
How you will read ?

⇒ /employee/name ✓
(or)

//name ✓

* if xml has multiple structures how you will read ?

Root node will come once, under that multiple records will exist

* How to read 2nd record from that ?

→ Java → array concept → [0, 1, 2, 3]

employees/employee[2]/name

↳ very ~~very~~ important

* Can we pick multiple headers in the property or header ?

Now I need some, parvan records, How
W~~an~~ Can do ?

Ans: no → Because property is a variable ~
it cannot store multiple values.

* demo → body → raw → XML data (Test input)

message header → xpath → employees/employee[3]/name

↓
employee[3]

→ we will get 3rd record

Testing

500 → internal
Server error ✓

* The main point here is the property or message
header stores only single value at a time ✓
if you want multiple records we need to
create the other fields in message header.

* Task → addition operation in Content modifiers

* Now Simulation is SAP CPI :

Simulation → Intermittent testing ✓

* Concat (llid, ll range)

* Simulation → only 10 pallets

Start → 1 to 10 → End ✓
Pallets

* In between the flow is there any external call?

the Simulation doesn't work

* Expressions → Standard expressions

eg: Current time → $\$ \{ \text{---} \}$

Current flow name → $\$ \{ \text{Camel id} \}$

* Pending → Source types → Content modifier

Local variable

Global variable

Number range ✓

Number range $\rightarrow$ if any iflow $\rightarrow$ triggered $\rightarrow$

100 times $\rightarrow$ But I want 66th message?

Can we identify $\rightarrow$ yes or no $\rightarrow$ Add $\rightarrow$ no
(Sender Won't Send Serial no)

$\rightarrow$ C/P1 $\rightarrow$ Seq no $\rightarrow$ Adding $\rightarrow$ number range

$\Rightarrow$ How to enable number range $\rightarrow$ Scenario

assigning $\rightarrow$ number $\rightarrow$ Series $\rightarrow$ to the $\rightarrow$ Incoming

payload $\rightarrow$ message Success $\rightarrow$

$\rightarrow$ goto $\rightarrow$ monitor tab $\rightarrow$ number range tiles $\rightarrow$

Add $\rightarrow$ NR_test $\rightarrow$ Sequence $\rightarrow$ minimum
name Description

value(0) $\rightarrow$ maximum value(?) $\rightarrow$

fixed length — ?

(Rotate) $\rightarrow$

$\rightarrow$ Number range:

Real time $\rightarrow$ Restric how many times this

flow should be hit & to know

Which time the flow is litted

at last $\rightarrow$
