

Day 15

## Exception Subprocess

\* What is exception Subprocess → if we want to handle any errors in cpi then we will use Exception Subprocess.

→ error handling → When you developed any Resource

→ When that Resource is operationable →

At that time → if any error occurs → What

you will do ? in SAP CPI ✓

\* eg: if you get any errors in cpi flows then

how to handle it ?

\* cpi → middleware tool → one System → 2nd System

data will be transferred → Suppose → you got →

error → if this error → not known by Source

System people → then problem.

\* Some times → We need to send that

error details to the Source System people

or we need to know → what happened.

eg: Scenario: postman → data → API → ielow →  
Email → notification ✓

→ Some how it is failed i'm between then  
what to do? (you must know the status → whether  
it is failed or success)

So for this situation or to overcome this  
scenario we will use exception Subprocess

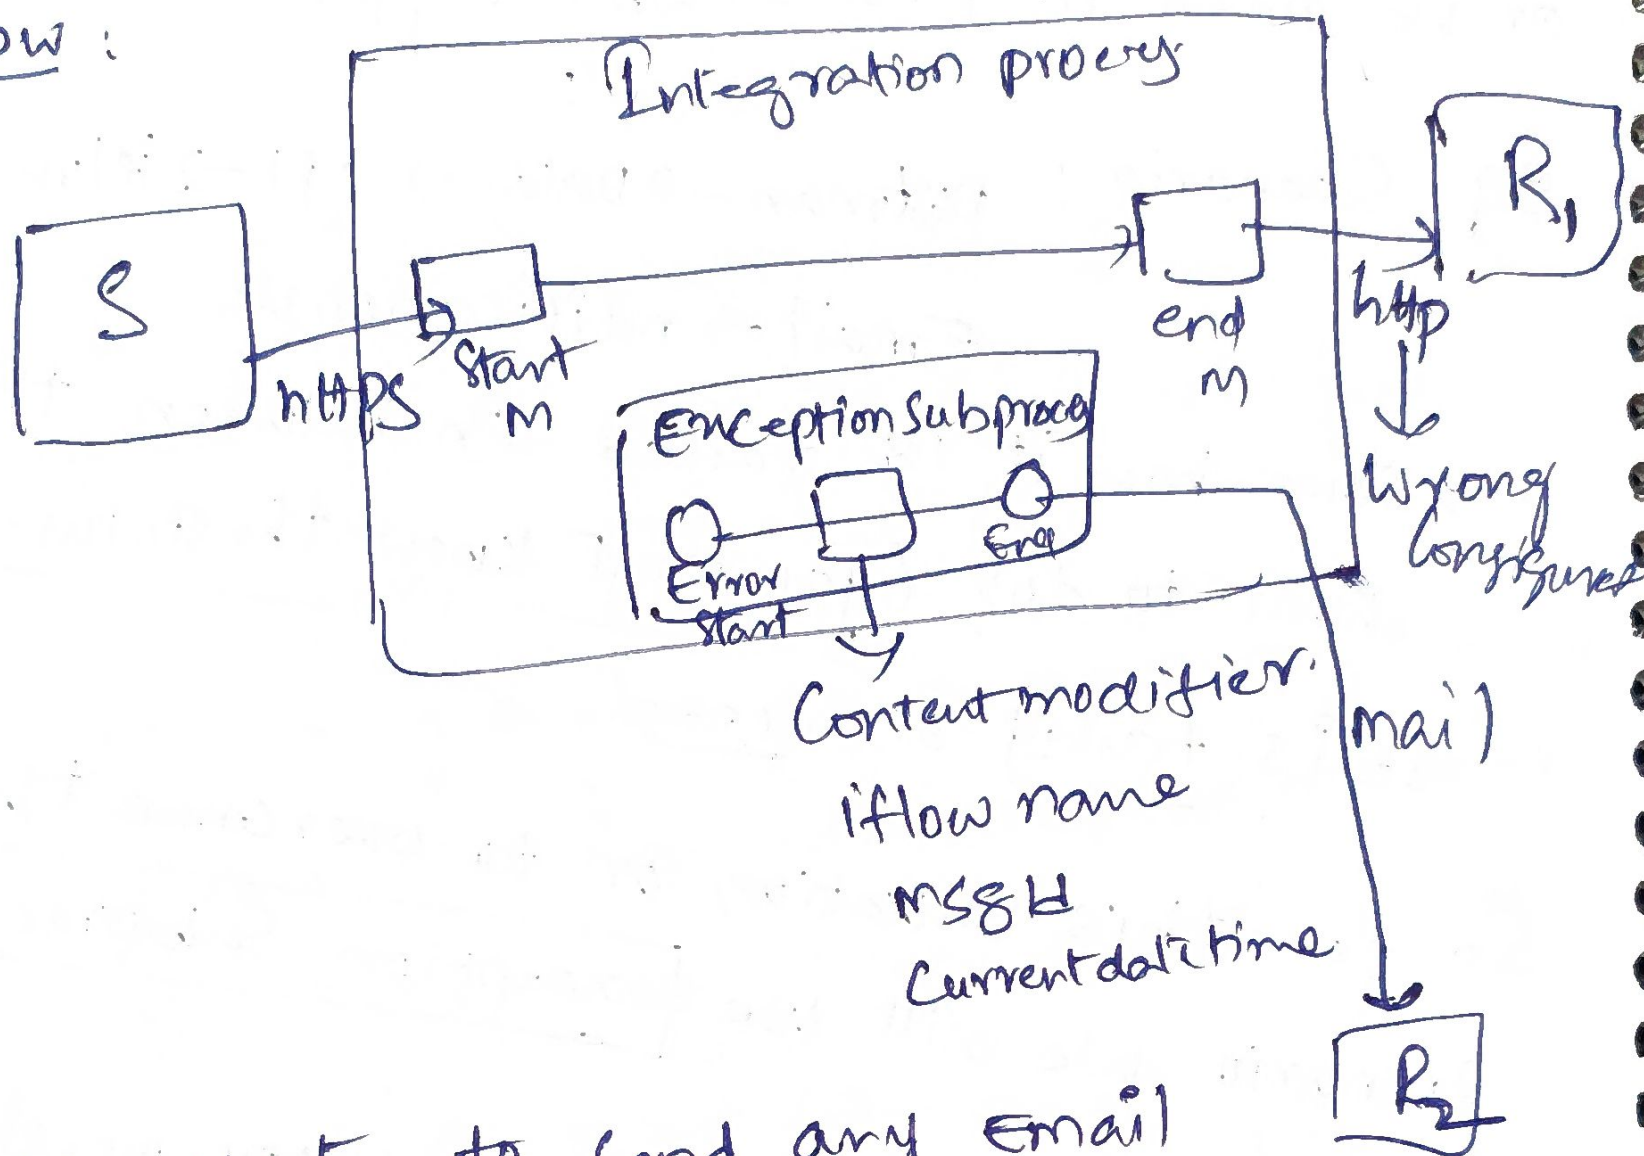

\* Scenario: if you get any error you need to  
Send an Email alert to the Support team  
or who ever responsible ✓  
We need to Send Email

→ Fields: ① ielow name (~~failed~~)  
(cancelled) } at least we  
② at what time need to pass  
③ msgid (property.SAP\_MPLD) }  
④ what is exception how will I do  
(error content) that

$\$ \{exception.message\}$

Flow :

\* If we want to send any email alert then we will use email Exception Subprocess  
 not only email alert → If we get an error  
 → Service now → Incident → create ticket  
 Relationship → if we get any error →  
 exception Subprocess → create ticket →

Service now

\* Error Content: \$ {exception.message} ✓  
Detail Log \$ {exception Stacktrace} ✓

\* In Exception Subprocess → we can use any palette options (functions).

Realtime Scenario → if you want to send any error ticket to the ServiceNow → we need to send it in Exception Subprocess. Why?

→ Normal Call → ticket's send → Every Success msg → will create a ticket → Send  
↓  
no encouragement (X)

→ Requirement → only error → ticket → create

→ Send ✓ Exception Subprocess

You cannot call Exception Subprocess explicitly → it is called internally

only there is an error ✓

\* We need to know where exactly the exception Subprocess will be called and where it is called ✓

Exception Subprocess → ~~only~~ called → only error  
→ main integration process → local Integration process ✓

\* We cannot call it directly but it triggers when the error occurs ✓

\* only passthrough Scenarios only →  
We will multiple main Integration processes  
in single flow
