Day 53

APIm Part 2

* yesterday it was just theoritical session on API management.
  → what is API management
  → where exactly use API management
* API management → only Inbound Scenarios →
  We will use ~~in~~ outbound (NO)
* SAP perspective Inbound & outbound
  ↓ ↓
  In Out
* SAP → Third (3rd) party (out bound)
* 3rd party → SAP (In bound)
* When they are talking about Inbound or out bound then we need to ask in which perspective you are talking
* like for example: SAP perspective

* How to start with API management

Practical: (Check API management Capability is enabled or not)

Step: How to activate API management

Step①: Add proper Role's for our user ✓

Step②: Check Capabilities in monitor Tab

Step③: Runtimes (Setting → Runtime)

Step④: Classic API management (Enable) Activate ✓

(Extra tab's After Activating Test, Configure, Analyze, Engage)

→ Configure tab → Configure → API's

* Let's start API management

→ Configure

API proxies, API providers, Certificates, key value maps, policy Templates.

→ API proxies: Which we will build → Consume

Subscribe → S4/HANA

→ API providers: It is used to connect any backend systems (S4/HANA)

→ Certificates: certificates creation or update

CPI keystores

APIM Certificates Import / Share or

→ Key value map's →

→ Policy Templates

* API management → steps to create API

(1) Create API provider.

(2) API proxy creation (provide or secure created API)

(3) creating a product

(4) creating a Application

→ API provider → Connect to Backend System (S4/HANA)

Create → API → Northwind not for Internet

SAP_SFTPProxy : on prem

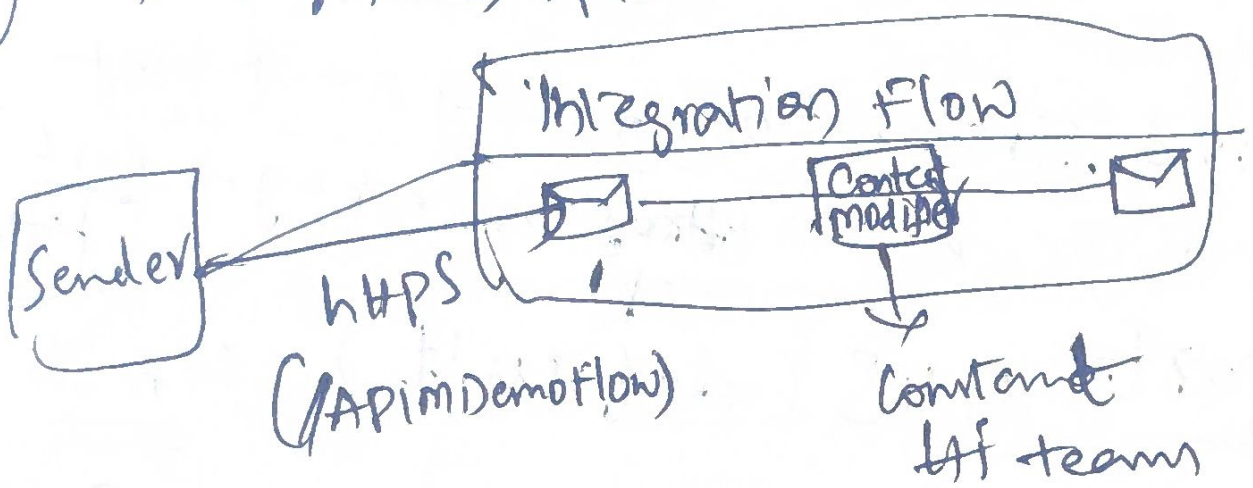

Scenario :

3rd party → APIM → CPI → Target

Location ID

Demo :

① Design → iFlow → APIDemoFlow

Save & deploy

② → next, create integration flow Plan

Service Keys & create API Service key

③ APIM → CPI iflow (How we will call)

Task

API provider → CPI Connection

→ overview, Connection, Catalog service settings

Name & Description	Connection Details
CPI Connection	Type: Internet, Onpremise, Open Connector, Cloud Integration

→ Cloud Integration management Host

eg: BTP Cockpit → ~~k~~ service key → URL
api Host

port: 443 (default). tenant URL

Authentication: OAuth2 (api) → service key details

client ID:

client secret:

→ Save

→ Test Connection

→ now, API proxie → creation

* We can create an api prony by using existing API provider

→ propdown → Discover (checks API Based flow*)
CPI → credentials → Connect
to our System
API Based Connection

→ checked Internet type Connection aswell

↓
northwind → host
443,

→ Create API proxie.

→ ~~Old~~ APIM proxie endpoint created

→ Test → postman or Test Tab

→ gatway Scenario, passthrough Scenarios

API providers → we will give api-service key details

API prony → integration flow
Service key details
