

Day 4 — SAP CPI Components (25 Aug 2026)

Note From Top of Page (Preview of Upcoming Topic)

Your trainer flagged three components to come, likely for the next session: **Worker Nodes, Messaging Services, and Security Engines**. Keep this in mind — we'll cover these in detail when your notes reach that point.

1. What Is BTP?

BTP = Business Technology Platform

It is a platform by SAP where **all services related to SAP** are placed under one roof — SAP BTP.

2. Where Is BTP "Located"? — Cloud Foundry

BTP is located on Cloud Foundry. Cloud Foundry itself provides **open cloud services**, and it runs across multiple hyperscaler providers:

- **Azure** (Microsoft)
- **AWS** (Amazon)
- **GCP** (Google Cloud Platform)

3. Before Cloud Foundry: SAP's Own Data Center — Neo

Before Cloud Foundry, SAP had its own data center-based environment called **Neo (Cockpit)**.

Verified — accurate note from class: "It is not compatible for all services" is correct. Neo runs only on SAP's own proprietary data centers and supports a limited, fixed set of services and runtimes. Cloud Foundry, by contrast, is open-source, runs across AWS/Azure/GCP, and supports the **full/broader** service catalog — which is exactly why Cloud Foundry became the default choice.

Extra detail worth knowing: SAP has officially announced that the **Neo environment will be phased out by December 31, 2028** (subject to individual contract terms). This reinforces why every new learner (including you) is taught Cloud Foundry from day one — Neo is a legacy environment on its way out.

4. SAP Discovery Center

Your trainer explained the **Discovery Center** — this is where you can browse **all ~82 services** available under BTP.

These 82 services are all provided by SAP, and multiple services exist under the BTP umbrella for different purposes.

5. Examples of Services Under BTP

Service	What It's For
CPI (Cloud Integration)	Core integration/middleware work — our main focus
APM (API Management)	Exposing and securing APIs
IA (Integration Advisor)	Used specifically for B2B scenarios — designing mappings/agreements between trading partners
Open Connectors	Pre-built connectors to third-party, non-SAP applications

6. SAP Data Centers — Global Spread

SAP's data centers are located in **different locations globally** — this is why, when creating an account (like your trial account), you're asked to choose a region. Data physically resides in the data center matching the region you select.

7. About Global Account

One Global Account can have multiple Subaccounts.

Example from class: Reliance Industries → 1 Global Account, with multiple Subaccounts underneath it.

Billing Behavior

Billing of usage will be allocated to that one main Global Account — even though usage happens across many different subaccounts, all charges roll up and get billed centrally at the Global Account level.

Exception Worth Noting

Example: Event Mesh is called out as a **separate service** — meaning some services like Event Mesh may be billed/tracked somewhat independently/separately rather than folding in exactly the same way as other services. (Your trainer flagged this as a specific example — we'll get more clarity as we go deeper into Event Mesh in a later module.)

8. Real-Time Landscape Structure — 3-Tier vs 4-Tier

In real company projects, subaccounts are typically organized into a staged landscape. Your notes cover two common patterns:

Landscape Type	Stages
3-Tier	Development → Quality → Production
4-Tier	Development → Quality → Pre-Production → Production

Why this matters in real projects: Developers build and test iFlows in **Development**, testers/business users validate them in **Quality**, and (in a 4-tier setup) a **Pre-Production** stage acts as a final near-identical rehearsal of the live system before anything reaches **Production** — where real business data and real customers are affected. Larger, more risk-sensitive companies (banking, healthcare, large manufacturing) are more likely to use the stricter 4-tier model; smaller or less risk-sensitive projects often use just 3-tier.
